The fine balance

Exploring the Interplay of Reproductive Strategies and Growth Dynamics in Trees

Xiaomao (Mao) Wang

Supervisor: Elizabeth Wolkovich

Table of content

- Brief background
- Research questions

What is masting?

Synchronized variation of large seed crop within a population between years

Characteristics:

- Interannual variation
- Synchrony
- Temporal autocorrelation
- frequency

Mast year

Mast year + 1

Mast year + 2

Hypotheses explaining masting

Predator satiation

Pollination coupling

Resource matching

Environmental cues

Research questions

Chapter 1: What reproductive traits relate to mast seeding?

Chapter 2: What is the relationship between masting and growth?

Chapter 3: How does changing climate affect seed dynamics?

Research questions

Chapter 1: What reproductive traits relate to mast seeding?

Chapter 2: What is the relationship between masting and growth?

Chapter 3: How does changing climate affect seed dynamics?

Chapter 1: Mast-Traits

- Masting can involve different, **non-mutually exclusive mechanisms** at different **reproductive stages**:
 - Pollination coupling (pollination)
 - Resource availability (seed maturation)
 - Predator satiation (seed dispersal)
- Species differ in **reproductive traits** that may influence these mechanisms.
- Trait–masting associations may therefore provide clues about the **evolutionary drivers** of masting.

Chapter 1: Mast-Traits

Chapter 1: Mast-Traits

Data:

Silvics of North America

Masting: strong or weak

Angiosperm:

- 98 with masting data
- 51 strong masting

Gymnosperm:

- 61 with masting data
- 54 strong masting

Chapter 1: Mast-Traits

Current progress:

- Statistical analyses
 - Single trait with phyloglm
 - Multivariate analysis with NMDS
- Outlines of the paper

Completed

- Manuscript write-up

On going

- Finalize some discussion on evolutionary aspects

Need discussion

Chapter 1: Mast-Traits

- Heavier seeds are associated with strong masting
- The effect was stronger among species with biotically dispersed seeds

Chapter 1: Mast-Traits

- Wind pollinated species are more likely to be strong masting
- All gymnosperms are wind-pollinated

Chapter 1: Mast-Traits

- Reproductive traits point to different stages of selection
 - Wind pollination → pollination coupling
 - Seed weight → predator satiation
 - Coordinated strategies across whole reproductive process
- Masting may be shaped differently across evolutionary contexts
 - Masting is population-level phenomenon, while traits were species-level
 - Strong phylogenetic structure of traits
 - Angiosperms vs. gymnosperms may represent different evolutionary pathways

Chapter 2: Growth-Reproduction Trade-off

Chapter 2: Growth-Reproduction Trade-off

Current progress:

- Core samples processing
- Cores measurement from 5 stands

Completed

- Cross-dating for cores
- Building the model

On going

Chapter 2: Growth-Reproduction Trade-off

Growth

$$BAI_{i,t} \sim \text{Normal}(\alpha_{BAI}, \sigma_{BAI})$$

$$G_{i,t} = BAI_{i,t} - \alpha_{BAI}$$

$$G_t = \text{mean}_i(G_i, t)$$

Reproduction

$$\text{Log}(\mu_{sc,t}) = \alpha_{sc} + \gamma_{\text{current}} \cdot G_t + \gamma_{\text{lag}} \cdot G_{t-1}$$

$$sc_t \sim \text{LogNormal}(\text{log}(\mu_{sc,t}), \sigma_{sc})$$

Chapter 2: Growth-Reproduction Trade-off
